

RADIO FREQUENCY INTERFERENCE (RFI) & ELECTRO-MAGNETIC INTERFERENCE (EMI)

The circuit boards in all Retronics modules have built in suppression against RFI & EMI. However, some classic vehicles may produce very high amounts of interference which could affect the operation of our modules. This can be caused by many factors, for example unsuppressed HT leads.

If the source of the interference can not be readily identified & remedied, it may be necessary to install an inline Suppressor to the red/black lead which supplies +12V to the Module's circuit board.
